

Medical Text Analysis

Prediction of Diabetes and it's many
Co-morbidities

Table of contents

01

Objectives

Why do we need to analyse medical text

03

Results analysis

The results of our analysis

02

Methodology

What data and methods we used to predict

04

Conclusions

The predictions and future direction

Goal

Clean and process the raw unstructured text data to predict (Yes or No) if a person has diabetes and it's many comorbid disorders

Why?

1

Analyzing medical text through NLP techniques in this project facilitates disease prediction and co-morbidity assessment.

2

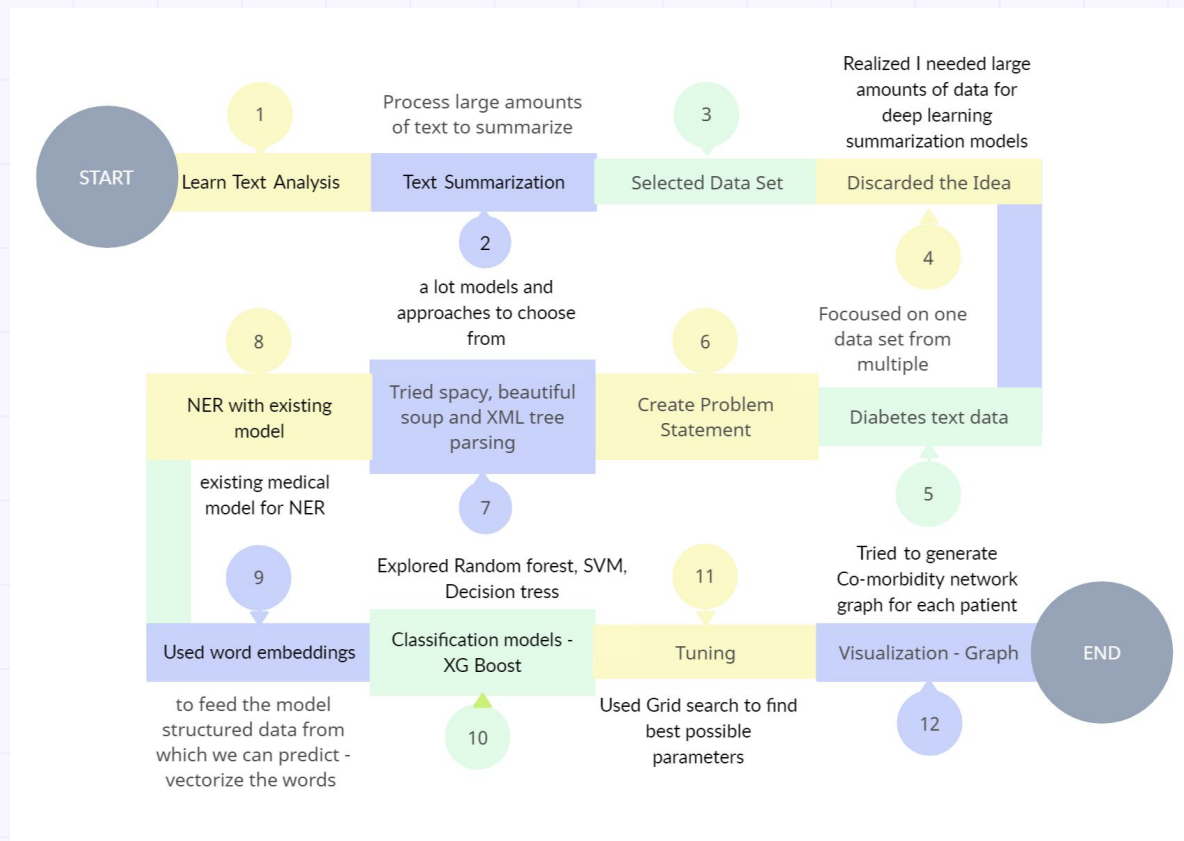

One person or medical professional might miss all the possible comorbidities associated with diabetes

3

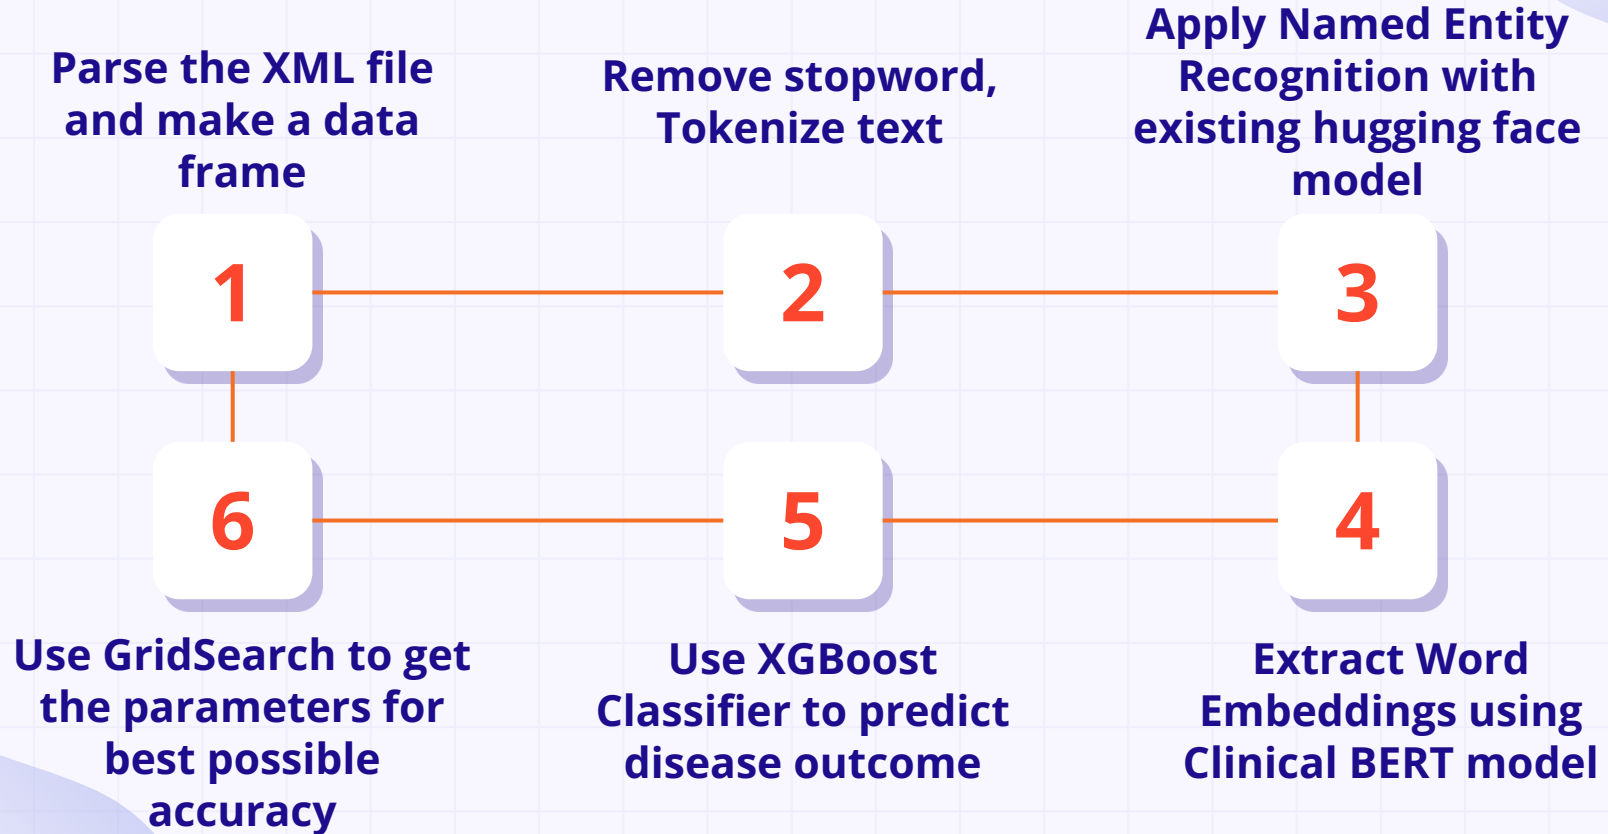

While structured values and categories offer easy analysis and results, most information is recorded in the medical text

Knowledge Process

Methods

Accuracy

60%

Congestive Heart Failure

74%

Diabetes

The model with it's best parameters predicts the outcome of Diabetes with 74% accuracy

75%

Osteoarthritis

Direction and final goal

Can be
used to
map all
disorders

The values
of how
closely the
words are
related

A Chart can be
generated for
each patient

When medical
text is provided
- output their
comorbidity
network graph

Conclusions

By using the medical text we can with reasonable accuracy predict if a person has diabetes or not. Accuracy can be improved with more data and better medically trained models
